TECHATRONICS

Instrumentation, Automation, Design, and Service

Instrumentation Automation and Design

Techatronics is an Engineering Firm that specializes in the Automation and Design of Measurement Equipment.

We merge the latest techniques in software with precision engineering to control and automate your entire lab or factory.

Automated Weighing Measurement System

Techatronics has integrated the latest in precision weighing with advanced software engineering to fully automate the weighing and counting of samples. Our software will count and weigh each sample and flag suspect samples without the intervention of an operator to fully automate the data collection process. We also provide a real-time graph, weight, count, and operating status. Configuration of the software is simple through the user-interface where you can change target weight, percent control, and graphics, on/off line testing and product identification.

Once a sample is placed into the automatic feeder, the operator presses the start button on the user-interface and walks away. The data is collected and stored in ASCII files where you can configure the destination. This engineering solution has been tested and will fully integrate into your current systems for a complete factory monitoring solution.
